packet assembly

The Challenge: **The Document Bottleneck**

An accountant had to manually open and assemble critical accounting packets, often containing 50-100+ individual files. The process, requiring an expensive Adobe license and over **15 manual steps per packet**, was agonizingly slow and risked costly compliance errors.

From Document Chaos to One-Click Control

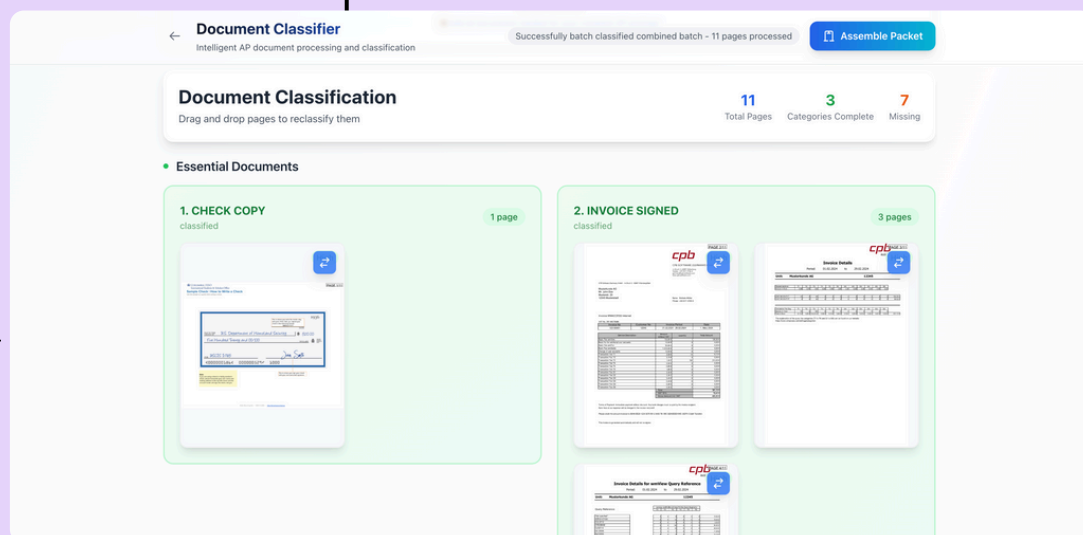

Tech Stack Used

The Solution: **A Digital Assembly Line**

I built a secure web application = a intelligent digital assembly line. The accountant can now drag and drop dozens of documents at once. The system uses computer vision to **automatically classify each file, sort them into the correct order, and compile a complete, ready-to-use PDF packet in seconds.**

This custom tool gives accounting professionals complete control over their workflow. What once took hours of tedious manual labor is now accomplished with a single click, ensuring accuracy and freeing up expert time for higher-value analysis.

This is More Than a Sorter—It's a Workflow Engine.

While this tool was built for the unique demands of production accounting, the core problem is **universal**: professionals wasting valuable time managing and assembling documents. This same powerful workflow engine can be applied to solve frustrating bottlenecks in any professional service, including:

- Assembling complex client tax packages for CPA firms.
- Organizing discovery documents and evidence for legal teams.
- Streamlining new-client onboarding paperwork for financial advisors.

I'll Find Your "Document Workflow" Problem.

Every business has a document workflow that drains time and creates risk.

I'll find yours, design a solution, and build it for you—all at my own expense.

You only pay for verified results. Let's talk.
